SOMA

FROM SOFTWARE TO A NEW COMPUTING FUTURE

A founder vision & roadmap

2026 foundation → 2030–2050 prototypes

Build useful software now.
Earn the right to build hardware later.

MOHITH SAI • OCTOBER 2026

Make technology feel more human.

SOMA is a long-term technology company vision—not a claim that every future device is already engineered.

One idea across every product:

People should be able to tell technology what they mean in plain language, use it with less friction, and stay in control of their data and decisions.

Human-first

Natural language, calm interfaces, useful defaults.

Trust-first

Privacy, clear permissions, visible control.

Software-first

Ship, test and learn before expensive hardware.

Long horizon

Prototype patiently; validate each step with real users.

North star: make computing easier to use—not more complicated to own.

Two software foundations. One direction.

Treat today's work as evidence and learning; future products remain a roadmap until tested.

AVAILABLE PROJECT

Hridaya OS CLI

A human-friendly command-line tool that accepts plain-English requests for practical computer tasks. It makes the terminal feel less robotic and more approachable.

npm package

npmjs.com/package/hridaya-os

CURRENT PRODUCT

Soma OS (2026)

A software-first desktop/workspace experiment built with web technologies. The near-term mission is to improve usability, stability, speed and everyday usefulness—not to claim a new kernel or hardware OS.

GitHub repository

github.com/Mohith933/SomaOS

The strategy **Build credibility through small releases, user feedback and reliable software before expanding into devices.**

Hridaya OS CLI — natural language for the computer.

The promise: users describe the task; Hridaya translates intent into practical, understandable actions.

```
C:\Users\you> hridaya

“Find my large files in Downloads”

“Create a React app named myapp”

“Help me understand this error”
```

Intent in. Clear action out.

Less memorising

Plain-English phrasing lowers the command barrier.

Useful tasks

Files, projects and system workflows.

Explainable

Show what will happen; avoid silent surprises.

Safe by design

Ask before destructive or high-impact actions.

Product principle: natural language should simplify the interface, not hide what the computer is doing.

Soma OS (2026) — prove the experience in software.

A browser-based desktop experience can be a serious product experiment without pretending to replace Windows, macOS or Linux underneath.

A calm workspace

A coherent desktop, familiar windows and a small set of useful built-in apps.

A useful toolset

File manager, notes, media, terminal and small utilities that work together.

A reliable core

Fast startup, responsive interactions, graceful errors and clear limits.

2026 focus:

- Fix core flows before adding more features.
- Test on real devices and weaker hardware.
- Make storage, offline behaviour and privacy claims precise.
- Publish a changelog and invite users to report issues.

Not a college. Not an agency. Not only a product shop.

SOMA's intended identity is a product-led technology company that learns by building, ships its own products and may later develop hardware.

MODEL	PRIMARY JOB	HOW IT CREATES VALUE	SOMA'S POSITION
Institution	Teach, research, certify	Knowledge, credentials, community	Learn continuously; publish real work
Service company	Solve a client's problem	Projects, delivery, expertise	Can fund learning—but avoid becoming only custom work
Product company	Solve a repeatable user problem	Reusable products, subscriptions or licensing	Core model: improve Hridaya and Soma OS
SOMA long-term	Build a trusted ecosystem	Software first; devices only when validated	A product-led studio with a hardware R&D horizon

The difference is not the label. It is the operating model: own the roadmap, learn from users, improve the product and build repeatable value.

One company. Three horizons.

Keep the near-term plan focused; do not let speculative devices distract from shipping the software foundation.

PROVE

Horizon 1 · 2026–2029

SOFTWARE FOUNDATION

- Hridaya OS CLI
- Soma OS desktop experience
- User feedback and reliability
- Documentation and community

EXPLORE

Horizon 2 · 2030–2040

CONNECTED PROTOTYPES

- Soma Watch (2030)
- Soma Cast Pro (2033)
- Soma Laptop (2035–2040)
- Soma Ring (2040)

IMAGINE

Horizon 3 · 2040–2050

AMBIENT COMPUTING

- Refine the ecosystem
- Test smaller, more natural interfaces
- Soma Air Tech (2050)
- Validate feasibility, safety and demand

Dates are aspiration targets, not commitments. Each stage depends on technical feasibility, funding, partners and user demand.

From desktop to devices—one proof at a time.

Each prototype should answer a real user question before the next investment is made.

2026

Soma OS

Software-first workspace

2030

Soma Watch

Glanceable, personal companion

2033

Soma Cast Pro

Shared-screen / casting experience

2035–40

Soma Laptop

A focused computing device

2040

Soma Ring

Low-friction wearable interactions

2050

Soma Air Tech

Ambient / spatial computing concept

Gate before each step: user need → proof of concept → safety & privacy review → cost / partner check → go or pause.

A product family, not a collection of gadgets.

The names express a direction. Their final form should come from customer discovery and technical tests.

Soma Watch · 2030

A small, glanceable extension of Soma: reminders, status and quick actions.

Soma Cast Pro · 2033

A simple way to move a workspace or media experience to a larger display.

Soma Laptop · 2035–2040

A focused, durable computer where Soma's software experience feels native.

Soma Ring · 2040

A low-friction companion for simple controls and context—only if battery, comfort and privacy work.

Soma Air Tech · 2050

A speculative ambient/spatial interface concept; define the problem before choosing the hardware.

Rule: no device just because it looks futuristic. Build only when it makes a real task meaningfully easier.

A realistic first 12-month plan.

The best way to make a 2050 vision credible is to ship something useful this year.

01 Stabilise
Prioritise bugs, performance, onboarding and clear product boundaries.

02 Observe
Talk to 10–20 target users; watch them try real tasks.

03 Release
Ship small, documented updates on a predictable cadence.

04 Measure
Track successful task completion, repeat use, crashes and support burden.

05 Fund
Explore a small paid tier, sponsorship, grants or selective services only if they support the product.

06 Decide
Use evidence to choose the next feature—not the size of the roadmap.

Success in year one = a dependable product, real users, honest evidence and a repeatable way to improve.

Trust is part of the product.

SOMA should be known for thoughtful engineering—not only ambitious concepts.

Plain language

Make the system's behaviour understandable to non-experts.

Human control

Ask before risky actions; make undo, cancel and exit obvious.

Privacy by default

Collect less data; explain what stays local and what leaves the device.

Accessibility

Design for different abilities, devices and levels of experience.

Honest claims

Separate working features, experiments, prototypes and long-term ideas.

Sustainable pace

Build in small steps; do not trade reliability for feature count.

SOMA

Start with software.
Grow through trust.
Reach for the future.

Hridaya OS CLI • Soma OS • Future prototypes

Build the next step. Prove it works. Then dream bigger.
